

Acknowledgments

This work was supported and managed by the U.S. Department of Energy, Yucca Mountain Site Characterization Office (YMP) as part of the Civilian Radioactive Waste Management Program. Data acquired as part of this activity and presented in this report were developed under YMP quality assurance procedures; their QA status and traceability to data tracking numbers or YMP notebooks are given in Appendix D. The record package containing traceability information for this report is LA-EES-1-TIP-97-004.

The YMP Test Coordination Office supported field sample collection in the ESF tunnel. We are grateful for sampling advice from S. Beason. In the laboratory, the efficient and seemingly tireless competence of J. Watt helped us maintain a high rate of sample processing. X. Ma and T. Miller were among the many individuals at PRIME Laboratory who worked assiduously to ensure timely and accurate isotopic analyses.
